Stetra Accessories

Accessories for Membrane and Board Installation

The Stetra Accessories range has been developed to complement waterproofing and uncoupling systems, ensuring secure installations, reliable sealing, and long-lasting performance. From waterproofing tapes and preformed corners to fixing systems and installation accessories, each component is designed to integrate perfectly with Stetra membranes, contributing to the creation of continuous, waterproof, and durable systems.

Designed for ease of installation and maximum compatibility, Stetra Accessories simplify the treatment of joints, corners, penetrations, and fixing points, reducing installation time while enhancing the overall reliability of the system. Ideal for residential, commercial, and wet-area applications, they provide all the essential components required to achieve a professional, safe, and long-lasting result.

Stetra Band

Code	Thickness	Length	Width
1305104075530	0,44 mm	30 m	150 mm
1305105075530	0,44 mm	30 m	250 mm

Stetra Band is a flexible polyethylene waterproofing tape designed to provide a watertight seal at joints and connections between waterproof membranes. Its low profile ensures a smooth and uniform installation, while the surface finish promotes excellent adhesion with mortars and sealants, creating a secure and durable bond.

Application: Stetra Band is specifically designed to effectively seal linear joints between walls and floors, as well as connections between waterproof membranes within waterproofing systems. It is ideal for use in indoor wet areas such as:

- Shower walls, spas, and bathrooms
- Connections between waterproofing membranes and shower trays, bathtubs, or washbasins
- Structural or movement joints requiring elasticity and watertight performance

The tape is quick and easy to install by overlapping membrane edges by at least 5 cm and bonding them with a suitable adhesive or mortar. This creates a continuous, leak-resistant waterproofing system that delivers excellent performance even in areas subject to structural movement.

Stetra Corner

Code	Type
CORNERIN	internal
CORNEROUT	external

Stetra Corners are prefabricated waterproof components designed for 90° internal and external junctions, manufactured from reinforced polymer membrane. Their seamless, monolithic design ensures a perfect watertight seal, while the reduced thickness minimizes build-up at corner transitions.

The flexibility of the material allows easy adaptation even to corners that are not perfectly square, ensuring a reliable and durable seal that helps prevent water infiltration and mould growth.

Application: Stetra Corners are designed to effectively seal wall-to-floor junctions and wall-to-wall connections within membrane-based waterproofing systems. Ideal for use in wet areas, they ensure continuity of the waterproofing layer at critical junctions, providing long-lasting protection against moisture penetration.
